Get ahead this Autumn

Regular servicing is vital:-

It promotes fuel economy, low emissions, reduces wear and tear, brings attention to any safety issues and a full service history will add resale value to the vehicle.

Manufactures Service Schedule

Some vehicles now can go 20,000 miles between services, therefore it is vital that the correct oils are use with appropriate additives for the engine to be able to cope.

We also use engine flushes and fuel additives where appropriate. Engine flushes, remove metal filing build up and debris, and make sure that more of the dirty oil is removed before adding the clean oil. The clean oil will stay cleaner for longer protecting the engine. Fuel additive remove carbon build and burnt fuel residue as well as sludge around the injectors. Therefore keeping the vehicle running smoothly.

The Manufactures recommend that the brake fluid should be changed every 2 year regardless of condition. This is the length of time that the Manufactures believe the brake fluid will last before absorbing to much water and reducing the boiling temperature. They also recommend that the Air Conditioning should be serviced annually, therefore removing bacteria, germs and micro-organisms.

So get on schedule
